

GENERATIVE BI

The Fusion of Gen-AI & Analytics

Pyramid Analytics, the leading AI-driven analytics solution incorporates Gen-AI together with numerous other AI capabilities deeply into its platform - ushering in the *GENERATIVE BI* era.

There are five key ingredients to Pyramid's Gen-BI capabilities:

Connect Gen-AI directly to your data

You shouldn't have to change your corporate data strategy to leverage Generative AI.

Pyramid allows you to immediately use your existing data investments by directly connecting to any data source (e.g. Redshift, Snowflake, Databricks, SQLServer Azure, SAP BW and many others). This delivers the fastest times to intelligence, eliminates redundancy and the cost of duplication and creates a highly scalable solution.

Question without concern

Regardless of what users ask, you cannot allow sensitive data leaks.

Pyramid doesn't pass actual data to any LLM's. Instead, we pass the information that helps the LLM understand your data context, like schemas and semantic models, while still delivering unsurpassed analytic capabilities on your data.

Sophisticated answers to complex questions

You need a real-world, conversational analytical companion to solve business problems instead of a copilot without wings.

Pyramid's sophisticated natural language interface handles complex analytical questions and scenarios that a user can literally deliver through speech. From data prep to publish, users can ask questions, perform complex analyses and create multi-layered content, dramatically speeding up the time to decisions.

Not all LLMs are created equal

You need specialized knowledge to handle business problems intelligently for different use cases.

So too with large language models (LLMs). Pyramid delivers a framework for a 'Multi-LLM' strategy, allowing customers to attune the right LLM to the right data. From generalized to verticalized LLMs, and from public or private to custom-built LLMs, Pyramid is catering for the Gen-AI of today and tomorrow.

Talk to your data from anywhere

Conversational analytics amps up the delivery of content embedded in other applications.

Embedded Pyramid content delivers a collection of deep AI capabilities DIRECTLY and SEAMLESSLY in your own apps, letting your users access AI-driven conversational analytics in context - unleashing powerful tools with practically no development.
